

Code clue

low-frequency slope 0
low-frequency slope -20
dB/dec
slope decreases after a
break
slope increases after a
break
obvious resonant peak
equal-distance breaks on
log axis

Likely meaning

no integrator dominates the low-frequency range
one integrator is likely present
one more pole starts to work
one zero / lead term starts to work
second-order oscillatory element with small damp-
ing
candidate equally spaced time constants
